

Bootstrap is a popular **front-end framework** used to build websites quickly and efficiently. It provides ready-made design components and layout tools using **HTML, CSS, and JavaScript**.

What Bootstrap actually is

Think of Bootstrap as a **design toolkit**. Instead of coding everything from scratch, you use its pre-built styles and components like:

- Navigation bars
 - Buttons
 - Forms
 - Cards
 - Modals (pop-up boxes)
-

How it helps with web design

1. Faster development

You don't need to design everything manually. Bootstrap already has styled components you can copy and use.

2. Responsive design (very important)

Bootstrap uses a **grid system** that automatically adjusts your layout for:

- Phones
- Tablets
- Laptops

So your website looks good on all screen sizes.

3. Consistent design

All elements follow a uniform style, making your website look clean and professional without much effort.

4. Built-in animations & components

You can easily add interactive features like:

- Carousels (image sliders)
- Dropdown menus
- Alerts
